

Are You Feeling the Computer Blues

Computer blues are never uncommon. Unfortunately, everyone can fall victim to different **computer issues** that range from simple software problems to more serious hard drive issues. Perhaps, more annoying, the computer suddenly shuts down and does not boot or flashes the dreaded “Blue Screen of Death.” This often signals hard drive corruption -- the worst computer problem anyone can deal with.

However, computers will usually have subtle signs that indicate impending **complex computer issues**. Often, mechanical components of the computer hard drive will gradually fail, and during this process you will notice your computer is not working well. If you can recognize the early warning signs of serious computer blues, you may be able to act accordingly or have the problems resolved by a reputable computer repair service provider. Of course, it is important to back up all your data before having the computer repaired.

Here are several signs that you need to be watchful of.

1. Unusual Beeps and Noises

This common sign is a result of mechanical failure in the hard drive’s read/write heads. To fix this problem, you can turn off the computer, remove the drive for a while and return it. If the same noise is still present, the problem may not be with the hard drive. Consider having a qualified technician diagnose the real problem.

2. Files Corrupted From Your Drive

If some of your files suddenly go missing from your drive, some serious **computer issues** might be brewing inside your drive. This symptom signals gradual failure in specific areas of the drive that makes it difficult to access the data properly. The most common cause of this problem is virus or malware infection.

3. Sudden slowing down of computer

A common computer blue encountered by many people is the sudden slow computer process. However, many tend to disregard this sign which leads to more **complex computer issues**. The computer will gradually start losing files and failure to boot may soon ensue. This is a definitive sign of an imminent computer issue.

4. Blue Screen of Death

The dreaded stop screen error signals the worst of computer blues that require immediate solution. Usually, it signals a critical failure in the computer system and would require professional help from an experienced computer technician.

While computer blues are common, you could actually prevent them from turning into major computer issues by taking particular attention to these signs of imminent computer problem.
